

create dtb file

1. copy .config to Linux source root directory (it is created by yocto)
2. make ARCH=arm CROSS_COMPILE=arm-linux-gnueabi- mv6220-toc.dtb

create kernel

There is arch/arm/configs/pegmatite_defconfig file.

```
$ make ARCH=arm CROSS_COMPILE=arm-linux-gnueabi-  
INSTALL_MOD_PATH=~/.work/kernel_mod pegmatite_defconfig
```

```
$ make ARCH=arm CROSS_COMPILE=arm-linux-gnueabi-  
INSTALL_MOD_PATH=~/.work/kernel_mod zImage
```

```
$ make ARCH=arm CROSS_COMPILE=arm-linux-gnueabi-  
INSTALL_MOD_PATH=~/.work/kernel_mod modules
```

```
$ make ARCH=arm CROSS_COMPILE=arm-linux-gnueabi-  
INSTALL_MOD_PATH=~/.work/kernel_mod modules_install
```

kernel modules are installed in work/kernel_mod/ directory.

```
$ walterzh@walterzh-ThinkPad-T440p:~$ tree work/kernel_mod/
```

```
work/kernel_mod/
```

```
└── lib
```

```
    ├── firmware
```

```
    |   └── sccp.bin
```

```

How to only build the specific directory of kernel ?

for example:

1. rebuild mm/ directory only

```
$ make ARCH=arm CROSS_COMPILE=arm-linux-gnueabi-
INSTALL_MOD_PATH=~/.work/kernel_mod mm/ clean
```

```
$ make ARCH=arm CROSS_COMPILE=arm-linux-gnueabi-
INSTALL_MOD_PATH=~/.work/kernel_mod mm/
```

2. rebuild drivers/i2c directory only

```
$ make ARCH=arm CROSS_COMPILE=arm-linux-gnueabi-  
INSTALL_MOD_PATH=~/.work/kernel_mod drivers/i2c/ clean
```

```
$ make ARCH=arm CROSS_COMPILE=arm-linux-gnueabi-  
INSTALL_MOD_PATH=~/.work/kernel_mod drivers/i2c/
```
