

udev's bb file is in poky/meta/recipes-core/udev
in udev.inc

```
1. EXTRA_OECONF = "--disable-introspection \  
2.                 --with-rootlibdir=${base_libdir} \  
3.                 --with-pci-ids-path=${datadir}/pci.ids \  
4.                 ac_cv_file_usr_share_pci_ids=no \  
5.                 ac_cv_file_usr_share_hwd_data_pci_ids=no \  
6.                 ac_cv_file_usr_share_misc_pci_ids=yes \  
7.                 --sbindir=${base_sbindir} \  
8.                 --libexecdir=${nonarch_base_libdir} \  
9.                 --with-rootlibdir=${base_libdir} \  
10.                --with-rootprefix= \  
11.                --without-systemdsystemunitdir \  
12.                --enable-debug \  
13.                "
```

添加了 `--enable-debug`

\$ bitbake -C fetch udev -f

但生成的udevvd还是优化过的，显然 `--enable-debug` 并不会生成无优化的Makefile

只能用dirty method.

step 1

in tmp/work/cortexa53-vfp-neon-poky-linux-gnueabi/udev/182-r9/build directory

autoconfig生成的Makefile位于该目录

把该Makefile中的 `-O2` and `-O1` 都替换成 `-O0`

step 2

in tmp/work/cortexa53-vfp-neon-poky-linux-gnueabi/udev/182-r9/temp directory

把run.do_compile文件中的 `-O2` and `-O1` 都替换成 `-O0`

step 3

in tmp/work/cortexa53-vfp-neon-poky-linux-gnueabi/udev/182-r9/build directory

\$ make -f Make clean

step 4

in tmp/work/cortexa53-vfp-neon-poky-linux-gnueabi/udev/182-r9/temp directory

\$ bash run.do_compile

check在tmp/work/cortexa53-vfp-neon-poky-linux-gnueabi/udev/182-r9/build directory
生成的udevvd,好像已经没有优化了(需要上机调试)

```

1. 000252bc <main>:
2.
3. int main(int argc, char *argv[])
4. {
5.     252bc:      e92d4800      push    {fp, lr}
6.     252c0:      e28db004      add     fp, sp, #4
7.     252c4:      e24ddd47      sub     sp, sp, #4544 ; 0x11c0
8.     252c8:      e24dd018      sub     sp, sp, #24
9.     252cc:      e24b3a01      sub     r3, fp, #4096 ; 0x1000

37.    25308:      e50b302c      str     r3, [fp, #-44] ; 0x2c
38.        struct epoll_event ep_ctrl, ep_inotify, ep_signal, ep_netlink, ep_wo
rker;
39.        struct udev_ctrl_connection *ctrl_conn = NULL;
40.    2530c:      e3a03000      mov     r3, #0
41.    25310:      e50b3010      str     r3, [fp, #-16]
42.        char **s;
43.        int rc = 1;
44.    25314:      e3a03001      mov     r3, #1
45.    25318:      e50b3014      str     r3, [fp, #-20]
46.
47.        udev = udev_new();
48.    2531c:      eb000bf0      bl      282e4 <udev_new>
49.    25320:      e50b0030      str     r0, [fp, #-48] ; 0x30
50.        if (udev == NULL)
51.    25324:      e51b3030      ldr     r3, [fp, #-48] ; 0x30
52.    25328:      e3530000      cmp     r3, #0

```

53.	2532c:	1a000000	bne	25334 <main+0x78>
54.		goto exit;		
55.	25330:	ea00070e	b	26f70 <main+0x1cb4>

而原来的udev生成的code如下

```

1.  int main(int argc, char *argv[])
2.  {
3.      b0fc:      e92d4ff0      push    {r4, r5, r6, r7, r8, r9, sl, fp, lr}
4.      b100:      e1a06000      mov     r6, r0
5.      b104:      e1a07001      mov     r7, r1
6.      b108:      ed2d8b02      vpush   {d8}
7.      b10c:      e24ddd6b      sub     sp, sp, #6848 ; 0x1ac0
8.      b110:      e24dd01c      sub     sp, sp, #28
9.      struct epoll_event ep_ctrl, ep_inotify, ep_signal, ep_netlink, ep_wor
rker;
10.     struct udev_ctrl_connection *ctrl_conn = NULL;
11.     char **s;
12.     int rc = 1;
13.
14.     udev = udev_new();
15.     b114:      eb004542      bl      1c624 <udev_new>
16.     if (udev == NULL)
17.     b118:      e2509000      subs    r9, r0, #0
18.     b11c:      0a0000c2      beq     b42c <main+0x330>
19.
20. #define UDEV_EXPORT __attribute__ ((visibility("default")))
21.
22. static inline void udev_log_init(const char *program_name)
23. {
24.     openlog(program_name, LOG_PID | LOG_CONS, LOG_DAEMON);
25.     b120:      e3070d7c      movw    r0, #32124 ; 0x7d7c
26.     b124:      e3a02018      mov     r2, #24
27.     b128:      e3a01003      mov     r1, #3
28.     b12c:      e3400002      movt    r0, #2
29.     b130:      ebfffe6d      bl      aaec <_init+0x674>
30.     goto exit;

```

明显看上去比较混乱。
