kernel 4.2.8, ARM64还没有支持CONFIG_DEBUG_USER.

in arch/arm/Kconfig.debug

```
1.   config DEBUG_USER
2.       bool "Verbose user fault messages"
3.       help
4.         When a user program crashes due to an exception, the kernel can
5.         print a brief message explaining what the problem was. This is
6.         sometimes helpful for debugging but serves no purpose on a
7.         production system. Most people should say N here.
8.
9.         In addition, you need to pass user_debug=N on the kernel command
10.        line to enable this feature.  N consists of the sum of:
11.
12.            1 - undefined instruction events
13.            2 - system calls
14.            4 - invalid data aborts
15.            8 - SIGSEGV faults
16.           16 - SIGBUS faults
```

但在arch/arm64/Kconfig.debug中没有定义。

另外 `CONFIG_DEBUG_USER` 目前只有 `arch/arm` 支持！
